# Additional information

#### Driver indicator lights:

On the top edge of the driver, colour indicator lights are displayed representing the various functions.

SAFIRA

SAFIRA

Green = Infusion

Yellow = Aspiration Flashing Red = System over pressure warning Steady Red = End of driver life

## To remove the syringe from the driver:

Press the square coloured button on the side of the driver. The syringe will release from the driver.

#### End of driver life indicator: •

Once the end of driver life indicator on the driver (steady red light) comes on, the component should be disposed of in accordance with hospital procedure. Do not start a procedure if the end of driver life indicator is already on. If the end of driver light indicator lights up during a procedure, immediately disconnect the syringe and either replace the driver or complete the procedure manually.

#### **KEY POINTS TO REMEMBER**

- Remove the black cap off the driver before use and dispose
- Never store the driver with a syringe attached

Comprehensive Instructions for Use are available via the Medovate website as well as being supplied with the product.

Please read the Instructions for Use before using SAFIRA<sup>®</sup> for the first time.

SAFIRA Giving Anaesthetists Contro

### SAFIRA® QUICK START GUIDE

medovate.co.uk

## Quick start: the SAFIRA® system

IMPORTANT: Please ensure the black protective foam cap is removed from the syringe driver and disposed.

Attach the foot pedal

or palm operator to operator the driver. The plug end of the cord goes into the socket.

Place the foot pedal on the floor below. near the surgical site in a convenient location or place palm operator on hand.

> Open the sterile package and remove sterile svringe: fill and prepare the svringe.

Please ensure all equipment is clean (if not brand new) and all relevant expiration checks are carried out in line with local procedures.

Connect the needle to the svringe. Once secured, prime the needle and tubing set to remove the air.

4.

Attach the sterile svringe to the driver (remove the black protective foam cap from the driver gear prior to connecting and dispose).

Alian svringe with the driver and gently press the syringe into the driver until you hear it "click" into place.

Press the infusion part of the foot pedal or palm operator (green end/button) to check that the tubing is correctly primed and the SAFIRA® system is operating as expected.

SAFIRA

infusion stopped on the driver, follow either of these two steps: A. Aspirate (yellow end of the foot pedal or button on palm operator) until red lights go out; or B. Release sterile syringe and re-click into place.

To reset the flashing red light /

6.

SAFIRA

Begin the anaesthetic procedure following local hospital guidelines. The SAFIRA<sup>®</sup> unit limits injection pressure to less than 20-psi by automatically stopping.

SAFIRA When the procedure is complete: A. Remove the single use syringe from

SAFIRA

Should an infusion stoppage be encountered

to allow low pressure infusion and

A. Verify needle patency and/or reposition needle

B. Reset the flashing red light (infusion stopped)

during the procedure:

alert on the driver unit.

the driver after the procedure. Failure to do so will drain the battery within 24 hours

- B. Dispose of the syringe using acceptable standard practice for biohazard waste: and
- C. Clean and store driver and foot pedal in accordance with hospital procedure for reuse.

Driver batteries are adequate for approximately 200 procedures.
